Dear Sir

### RE: DAIRI ZINC/LEAD PROJECT - SUMATRA

Assay results from diamond drill hole SOP59D, targeting a downhole electric – magnetic (DHEM) anomaly at the Lae Jehe prospect, are available from the mineralised upper zone starting at 336m.

They are:

From	To	Width	True Width	% Zn	% Pb
336.0	342.0	6.0	5.2	5.6	2.8
* 345.30	351.35	6.05	5.2	10.0	5.6

\* Includes 0.3m (346.0 – 346.3m) at an assumed grade of 2.6%Zn, and 1.3% Pb.

Assays of two deeper but thinner sulphide intercepts have not been received and shall be reported as part of future ASX announcements.

The importance of this exploration hole is that it intersected a massive sulphide zone predicted by DHEM survey, and this enhances the chance of finding zones of high grade massive sulphides in areas other than the reported Anjing Hitam and Base Camp resources (10mt @ 15%zinc, 9% lead).

Le Jehe is approximately 2km grid north of Anjing Hitam.

Yours faithfully

**M P WRIGHT**  
Executive Director
